TEAM KRATOS-X · TEAM PLAN

Lefty

The plan to make Lefty fast, honest and powered by our own brain: features, roles, machines and timeline.

Sanjay · Varun · Josheetha · Kishore · Sriram · 2 November 2026

WHERE WE ARE

Lefty 0.1.5 runs, not reliably yet

Works

- Clean install, uninstall and reinstall
- Brain answers in about 5 s
- Reads 93 buttons in 0.1 s
- All automated tests pass

Fixed this week

The bubble crashed on load, so no message ever got a reply. A script loaded in the wrong order. Fixed, rebuilt and reinstalled.

Not yet

- VS Code took a minute and never opened
- Ghost code ignored in Do it mode
- Says “Done” when nothing happened

KNOWN PROBLEMS

What is broken today

What happens	The fix
Thinks for a minute, never opens VS Code	Find the cause with logs; stop wasted model retries
Ignores “ghost code” in Do it mode	What you ask for beats the mode switch
Says “Done” when nothing happened	Fail out loud, in plain words
Forgets what “it” means in a follow-up	Remember the previous turn
Ghost code breaks in Restricted Mode	Native editor extensions (Phase 4)
Tests passed while the app was broken	Tests fail on any overlay error

THE GOAL

Lefty sees your screen, plans the job, does it with you and checks every step.

On any app. Online with Gemini, offline with our own model.

BUILD PLAN

Six phases, in order

Fix what's broken

Honest answers, memory, planning, step checks, real tests.

Phase 0 · Sanjay

Presence, control

Floating companion, live status, permission button.

Phase 1 · Sanjay

Window and bubble

Chat in the main page, doing in the bubble.

Phase 2 · Sanjay

New abilities

Uploads, PDFs, any app, places, images, terminal.

Phase 3 · Sanjay, Josheetha tests

Native ghost code

Extensions for VS Code and PyCharm.

Phase 4 · Kishore

Our own brain

Local models, offline voice, fine-tuned Lefty-8B.

Phase 5 · Varun, Sriram

BUILD PLAN

Phases 0–1: fix him, show him

Phase 0 · Fix what is broken

1. VS Code open failure and slow thinking
2. What you ask for beats the mode
3. Never claim “Done” falsely
4. Remember the previous turn
5. Plan first: 3–5 steps, shown live
6. Check every step, retry another way
7. Memory layer and step logging
8. Tests that catch real breakage

Phase 1 · Presence and control

1. Floating cursor companion over every app
2. Live status bubble, updated every step
3. No highlighting in Do it mode
4. Clicks without moving your mouse
5. Permission button: Ask, Auto, Full access

BUILD PLAN

Phases 2–3: chat and new skills

Phase 2 · Window and bubble

1. Main page is a text chat
2. Bubble points and does
3. Long answers open the main window
4. Main-page tasks keep running behind
5. Closing the main window shows the bubble
6. Answers stream in word by word

Phase 3 · New abilities

1. “+” upload for images and PDFs
2. Answer a PDF of questions
3. Open and operate any app
4. Places: price, rating and his pick
5. Websites and code (builder exists)
6. Image generation with Gemini
7. Terminal, under the permission button
8. Permission button replaces old limits

BUILD PLAN

Phases 4–5: ghost code, own brain

Phase 4 · Native ghost code

1. VS Code extension, native ghost text
2. Tab accepts, Esc dismisses
3. Works in Cursor, Windsurf, Antigravity
4. Works in Restricted Mode
5. PyCharm plugin with the same ghost text

Phase 5 · Our own brain

1. 8B text brain on the LOQ via Ollama
2. 3B vision model on the Victus
3. Offline voice (Whisper) on the Lenovo
4. Falls back to Gemini if a machine is down
5. Benchmark on 20 real tasks
6. Fine-tune Lefty-8B, show before and after
7. Offline images with SD-Turbo
8. Live dashboard of all machines

THE TEAM

Five people, four laptops

Sanjay

HP Victus · RTX 2050

Lead · frontend and backend

- The Lefty app
- Phases 0–3
- Redesign build
- Merges everyone's work

Varun

Lenovo LOQ · RTX 3050 6 GB

AI and brain

- Ollama server
- Model benchmarks
- Data cleaning
- Fine-tuning Lefty-8B

Josheetha

Basic HP

Design and testing

- Reference pictures, mockups
- Test checklist
- 20 benchmark tasks
- Demo script

Kishore, Sriram

Lenovo · Radeon 820M

Integrations and ears

- Kishore: VS Code and PyCharm ghost code
- Sriram: offline voice and dashboard
- Split proposed

THE MACHINES

Eyes, brain and ears

Eyes

HP Victus · RTX 2050 4 GB

3B vision model and the Lefty app. Reads screenshots, photos and scans.

Brain

Lenovo LOQ · RTX 3050 6 GB

8B text model. Plans, picks buttons, answers.

Ears

Lenovo · Ryzen AI 5 330

Whisper speech-to-text. Offline voice, memory and dashboard.

Cloud

Google Gemini

Images, long PDFs, code, places search, fallback.

All on our own phone hotspot. One model per machine, always loaded, so nothing swaps.

ROUTING

Which brain does what

Job	Goes to
Normal app steps (button list as text)	8B text model on the LOQ
No button list, photos, scanned PDFs	3B vision model on the Victus
Voice	Whisper on the Lenovo
Long PDFs, big code, places search	Gemini
Images	Gemini online, SD-Turbo on the Victus offline
Any machine down	Gemini takes over

One rule: each request goes to one model. No chaining vision into text on every step.

LOCAL MODELS

What fits on our graphics cards

Model (4-bit)	Memory	Victus 4 GB	LOQ 6 GB
3–4B with vision	~3–3.5 GB	Fits	Fits
7–8B text only	~5–5.5 GB	Too big	Fits, with settings
7–8B with vision	~6–7 GB	Too big	Spills over, slow

Speed

8B text on the LOQ: about 3–6 s a step. Gemini today: about 3–5 s.

Context

A Lefty request is about 1,900 tokens. A 4,000-token window is enough.

LOQ settings

Flash attention on, q8_0 context cache: about half the context memory.

IMAGE GENERATION

Images, online and offline

Online · Gemini

- Image models already on our key
- A few seconds per image, best quality
- Edits images you upload
- To check: free-tier image limit

Offline · SD-Turbo on the Victus

- Briefly unloads the vision model
- About 3–6 s per 512×512 image
- Plus a 10–20 s swap
- Check the licence before selling

Not on the LOQ: unloading the brain offline would freeze Lefty. Vision is needed only now and then, so the Victus can lend its card.

LEARNING

He gets better with use

After every chat · memory

- Solved routes replay with no AI call
- Remembers corrections and preferences
- Works with any brain, Gemini included
- You can view and delete what he keeps

Every week · fine-tuning

- Collect verified good steps
- Fine-tune on free Colab or Kaggle GPUs
- Score on the 20-task benchmark
- Switch only if it scores higher

Timeline: first version about 4–6 days focused, or 1.5–3 weeks part-time. Later versions about 1 day each. Start logging in Phase 0.

WORKING TOGETHER

How we work together

One task list, three uses

Josheetha writes 20 real tasks. Varun scores each model on them. Sanjay uses them to catch bugs.

Data flows to the brain

Lefty logs every verified step from Phase 0. Varun cleans it and fine-tunes Lefty-8B.

One agreed connection

Kishore's extensions and Sriram's voice talk to Lefty through one interface agreed with Sanjay at the start.

Branches, one plan file

One git branch each, Sanjay merges. No commits during the selection round until we decide. Plans live in IDEA TO BE DONE.txt.

DEMO DAY

Demo day checklist

- ✓ All laptops on our own phone hotspot
- ✓ A written demo script, rehearsed
- ✓ A one-click start script on each laptop
- ✓ Chargers and a power strip, never battery
- ✓ A recorded backup video
- ✓ The offline moment: Wi-Fi off, Lefty still works

OPEN QUESTIONS

Still to decide

Question	Why it matters
When is the next round?	Decides if the fine-tuned model makes the demo
Passwords in Full access mode?	Safety versus no limits
Keep the no-emoji, line-icon style?	Sets the redesign rules
RAM on the LOQ, Lenovo and HP?	Confirms the model plan
Kishore and Sriram split?	Marked as proposed for now
Gemini image free-tier limit?	Decides if images need billing
